

This project is designed to help tourists navigate the overwhelming amount of information on Indian travel. The problem is simple—there's just too much unreliable stuff online, and it messes up the mind of the traveler. So much noise, so little clarity. This project offers a curated, storytelling-based guide to Indian states, focusing on folk tales, historical facts, and must-visit places, brought together in a neat Python script.

Users can pick states to explore in a unique recursive journey. Each state reveals its story, a folk tale, a moral, and famous landmarks, printed with a slow, typewriter effect for that immersive feel. No complex setups—just Python and genuine content.

The project aims to bring clarity, a bit of magic, and real connection to anyone lost in the endless swirl of travel info. It's for tourists, solo travelers, families, even students who want to feel the culture, history, and soul behind the places.

Technically, it's lightweight, uses recursion creatively, and thrives on simplicity. It's a bridge between culture and code, turning data into tales, and overwhelmed travelers into curious explorers.
